**EXERCISES 11**

A. ZEYTIN

Unless otherwise stated  $R$  is a commutative ring with 1.

- (1) Show that being associates is an equivalence relation. Determine the equivalence classes of 0 and 1.
- (2) Assume that two elements  $a, b \in R$  are associates. Show that
  - ▶  $a$  and  $b$  generate the same ideal, that is :  $(a) = (b)$ .
  - ▶  $a$  is irreducible if and only if  $b$  is irreducible.
  - ▶  $a$  is invertible if and only if  $b$  is invertible.
  - ▶  $a$  is prime if and only if  $b$  is prime.
- (3) Let  $R_n = (\mathbf{Z}/n\mathbf{Z})[X]$ . For the following values of  $n$ , show that  $X$  is not irreducible.
  - ▶ 15
  - ▶ 21
  - ▶ 22
  - ▶ 30
  - ▶ 210

Hint: Try to modify the method used in class for the  $n = 6$  case.
- (4) Let  $R$  be a PID and let  $I$  be a non-zero ideal. Show that  $I$  is prime if and only if  $I$  is maximal.
- (5) Let  $R$  be an integral domain. Show that  $R$  is a UFD if and only if every non-zero prime ideal contains a non-zero principal prime ideal.
- (6) Show that the ring  $\mathbf{R}[X^2, X^3]$  is not a UFD.
- (7) In  $\mathbf{Z}[\sqrt{-1}]$  find the factorization of 2 and 13 into irreducibles.
- (8) In  $\mathbf{Z}[\sqrt{-5}]$  show that the ideal  $(3, 2 + \sqrt{-5})$  is not principal.
- (9) If  $R$  is an integral domain, show that the ideal  $I = (X, Y)$  in the ring  $R[X, Y]$  is not principal. Show by an example that non-existence of zero divisors is necessary for the claim to hold.
- (10) Show that  $\mathbf{Z}[X]$  is a UFD but not a PID.
- (11) In this exercise, we will prove that if  $R$  is a PID, then it is a UFD.  $R$  is called *Noetherian* if any given increasing sequence of ideals  $I_1 \subseteq I_2 \subseteq I_3 \subseteq \dots$  in  $R$  stabilizes, that is, there is a positive integer  $n$  so that  $I_n = I_{n+1} = I_{n+2} = \dots$ . Let  $R$  be a PID.
  - ▶ Show that a PID is Noetherian.
  - ▶ From now on we assume that  $R$  is a PID. Show that any non-invertible element of  $R$  is divisible by an irreducible element. Hint: Proceed by contradiction.
  - ▶ Deduce that any  $a \in R$  is a product of irreducibles and possibly an invertible element; that is, there are (not necessarily distinct) irreducible elements  $p_1, p_2, \dots, p_n \in R$  and  $u \in R^\times$  so that  $a = up_1 \cdot p_2 \cdot \dots \cdot p_n$ .
  - ▶ Show that the above representation is unique up to associates (and reordering).
